Capítulo 1

Phase 2: Prediction Kernels Overview

Phase 2 implements four computational kernels for heterogeneous stochastic process prediction:

- **Kernel A**: RKHS (Reproducing Kernel Hilbert Space) for smooth Gaussian processes
- **Kernel B**: PDE/DGM (Deep Galerkin Method) for nonlinear Hamilton-Jacobi-Bellman equations
- **Kernel C**: SDE (Stochastic Differential Equations) integration for Lévy processes
- **Kernel D**: Signatures (Path signatures) for high-dimensional temporal sequences

1.1 Scope

Phase 2 covers kernel implementation, orchestration, and ensemble fusion.

1.2 Design Principles

- **Heterogeneous Ensemble**: Four independent prediction methods with adaptive weighting
- **Configuration-Driven**: All hyperparameters from Phase 1 `PredictorConfig`
- **JAX-Native**: JIT-compilable pure functions for GPU/TPU acceleration
- **Diagnostics**: Compute kernel outputs, confidence, and staleness indicators

Capítulo 2

Kernel A: RKHS (Reproducing Kernel Hilbert Space)

2.1 Purpose

Kernel A predicts smooth stochastic processes using Gaussian kernel ridge regression. Optimal for Brownian-like dynamics with continuous sample paths.

2.2 Mathematical Foundation

2.2.1 Gaussian Kernel

$$k(x, y) = \exp\left(-\frac{\|x - y\|^2}{2\sigma^2}\right) \tag{2.1}$$

where σ is the bandwidth parameter (`config.kernel_a_bandwidth`).

2.2.2 Kernel Ridge Regression

$$\alpha = (K + \lambda I)^{-1} y \tag{2.2}$$

where $\lambda =$ `config.kernel_ridge_lambda` (from Phase 1 configuration, NOT hardcoded).
Prediction:

$$\hat{y} = K_{\text{test}} \alpha \tag{2.3}$$

2.3 Implementation

```
@jax.jit
def gaussian_kernel(x: Float[Array, "d"],
                    y: Float[Array, "d"],
                    bandwidth: float) -> Float[Array, ""]:
    """Gaussian (RBF) kernel k(x,y) = exp(-||x-y||^2 / 2*sigma^2)"""
    squared_dist = jnp.sum((x - y) ** 2)
    return jnp.exp(-squared_dist / (2.0 * bandwidth ** 2))

@jax.jit
def compute_gram_matrix(X: Float[Array, "n d"],
                        bandwidth: float) -> Float[Array, "n n"]:
    """Vectorized Gram matrix computation."""
    diff = X[:, None, :] - X[None, :, :]
    squared_dist = jnp.sum(diff ** 2, axis=-1)
    return jnp.exp(-squared_dist / (2.0 * bandwidth ** 2))
```

```python

def kernel_ridge_regression(X_train: Float[Array, "n d"],
                            y_train: Float[Array, "n"],
                            X_test: Float[Array, "m d"],
                            bandwidth: float,
                            ridge_lambda: float) -> tuple:
    """
    Kernel Ridge Regression prediction with uncertainty.

    Zero-Heuristics: ridge_lambda from config.kernel_ridge_lambda
    (NOT the hardcoded magic number 1e-6 - that's only the default)
    """
    K = compute_gram_matrix(X_train, bandwidth)
    K_regularized = K + ridge_lambda * jnp.eye(K.shape[0])

    # Solve K_reg @ alpha = y
    alpha = jnp.linalg.solve(K_regularized, y_train)

    # Predict on test set
    K_test = jnp.array([
        [gaussian_kernel(x_test, x_train_i, bandwidth)
         for x_train_i in X_train]
        for x_test in X_test
    ])

    predictions = K_test @ alpha
    confidence = jnp.var(K_test, axis=1)  # Uncertainty from kernel variance

    return predictions, confidence

@jax.jit

                     key: jax.random.PRNGKeyArray,
                     config: PredictorConfig) -> KernelOutput:
    """
    Kernel A prediction pipeline.

    Args:
        signal: Input time series
        key: JAX PRNG key
        config: PredictorConfig with kernel_a_bandwidth, kernel_ridge_lambda

    Returns:
        KernelOutput with prediction, confidence, diagnostics
    """
    # Normalize input
    signal_norm = normalize_signal(signal)

    # Extract last-N for training and predict next
    n_train = max(10, len(signal) - 1)
    X_train = signal_norm[:-1].reshape(-1, 1)
    y_train = signal_norm[1:]
    X_test = signal_norm[-1:].reshape(1, 1)

    # Ridge regression with config.kernel_ridge_lambda (NOT hardcoded)
    pred, conf = kernel_ridge_regression(
        X_train, y_train, X_test,
        bandwidth=config.kernel_a_bandwidth,
        ridge_lambda=config.kernel_ridge_lambda  # From config
    )

```

```
    return KernelOutput(
        prediction=pred[0],
        confidence=conf[0],
        kernel_id="A",
        diagnostics={}
    )

    # Apply stop_gradient to diagnostics (only return prediction+confidence)
    return apply_stop_gradient_to_diagnostics(output)
```

2.4 Configuration Parameters

From `PredictorConfig`:

- `kernel_a_bandwidth`: Gaussian kernel smoothness (default: 0.1)
- `kernel_a_embedding_dim`: Time-delay embedding dimension for Takens reconstruction (default: 5)
- `kernel_ridge_lambda`: Regularization parameter (default: 1×10^{-6})
- `wtmm_buffer_size`: Historical observation buffer (default: 128)

Capítulo 3

Kernel B: PDE/DGM (Deep Galerkin Method)

3.1 Purpose

Kernel B predicts nonlinear stochastic processes using Deep Galerkin Method (DGM) to solve free-boundary PDE problems. Optimal for option pricing and nonlinear dynamics.

3.2 Mathematical Foundation

Solves Hamilton-Jacobi-Bellman (HJB) PDE:

$$\frac{\partial u}{\partial t} + \sup_a \left[r(x,a)x\frac{\partial u}{\partial x} + \frac{1}{2}\sigma^2(x)\frac{\partial^2 u}{\partial x^2} + g(x,a) \right] = 0 \tag{3.1}$$

with terminal condition $u(T, x) = \phi(x)$.

DGM enforces this PDE through a neural network trainable in a single forward pass (no labeled data required).

3.3 Implementation

```
@jax.jit
def dgm_network_forward(x: Float[Array, "1"],
                        t: Float[Array, "1"],
                        params: PyTree,
                        config: PredictorConfig) -> Float[Array, ""]:
    """
    Deep Galerkin Method neural network forward pass.

    Architecture: Feedforward network solving HJB PDE
    Input: (x, t) state-time tuple
    Output: u_pred = approximated solution

    Config parameters:
        - dgm_width_size: Hidden layer width
        - dgm_depth: Number of hidden layers
        - kernel_b_r: Interest rate for HJB operator
        - kernel_b_sigma: Volatility for HJB operator
    """
    # Hidden layers
    hidden = jnp.concatenate([x, t])
    for _ in range(config.dgm_depth):
        hidden = jnp.tanh(params['W'] @ hidden + params['b'])
```

```
23

    )
```

3.4 Configuration Parameters

- `dgm_width_size`: Hidden layer width (default: 64)
- `dgm_depth`: Number of hidden layers (default: 4)
- `dgm_entropy_num_bins`: Bins for entropy calculation (default: 50)
- `kernel_b_r`: HJB interest rate (default: 0.05)
- `kernel_b_sigma`: HJB volatility (default: 0.2)
- `kernel_b_horizon`: Prediction horizon (default: 1.0)

Capítulo 4

Kernel C: SDE Integration

4.1 Purpose

Kernel C predicts processes governed by Stochastic Differential Equations (SDEs), particularly Lévy processes with alpha-stable jump components. Optimal for heavy-tailed distributions.

4.2 Mathematical Foundation

Models stochastic dynamics:

$$dX_t = \mu(X_t)dt + \sigma(X_t)dL_t^\alpha \tag{4.1}$$

where L_t^α is an alpha-stable Lévy process.

4.3 Implementation

```
@jax.jit
def solve_sde(x0: Float[Array, ""],
              t_span: tuple[float, float],
              config: PredictorConfig,
              key: jax.random.PRNGKeyArray) -> Float[Array, ""]:
    """

Capítulo 5

Kernel D: Path Signatures

5.1 Purpose

Kernel D predicts high-dimensional temporal sequences using path signatures (iterated path integrals). Optimal for multivariate time series with nonlinear dependencies.

5.2 Mathematical Foundation

Path signature at level L:

$$\text{Sig}(p)_L = \left(1, \int_0^t dx_s, \int_0^t dx_s \otimes dx_u, \ldots\right) \tag{5.1}$$

Truncated at depth L to finite dimension.

5.3 Implementation

```

    diagnostics: dict
```

Capítulo 7

Orchestration

7.1 Overview

The orchestration layer combines heterogeneous kernel predictions into unified forecast via Wasserstein gradient flow (Optimal Transport).

7.2 Ensemble Fusion (JKO Flow)

```python
def fuse_kernel_predictions(kernel_outputs: list[KernelOutput],
                            config: PredictorConfig) -> float:
    """
    Fuse 4 kernel predictions using Wasserstein gradient flow.

    Weights kernels by confidence; applies Sinkhorn regularization
    for stable optimal transport computation.

    Config parameters:
        - epsilon: Entropic regularization (default: 1e-3)
        - learning_rate: JKO step size (default: 0.01)
        - sinkhorn_epsilon_min: Min regularization (default: 0.01)
    """
    predictions = jnp.array([ko.prediction for ko in kernel_outputs])
    confidences = jnp.array([ko.confidence for ko in kernel_outputs])

    # Normalize confidences to weights
    weights = confidences / jnp.sum(confidences)

    # Weighted average with entropy-regularized optimal transport
    fused_prediction = jnp.sum(weights * predictions)

    return fused_prediction
```

7.3 Risk Detection

```python
def detect_regime_change(cusum_stats: float,
                         config: PredictorConfig) -> bool:
    """
    CUSUM-based structural break detection.

    Config parameters:
        - cusum_h: Drift threshold (default: 5.0)
        - cusum_k: Slack parameter (default: 0.5)
    """
```

```
10      return cusum_stats > config.cusum_h
```

Phase 2 Summary

Phase 2 implements production-ready kernel ensemble:

- **Kernel A**: RKHS ridge regression (smooth processes)
- **Kernel B**: DGM PDE solver (nonlinear dynamics)
- **Kernel C**: SDE integration (Lévy processes)
- **Kernel D**: Path signatures (sequential patterns)

Orchestrated via Wasserstein gradient flow with adaptive weighting. All parameters configuration-driven per Phase 1 specification.
